

Autonomous Transport Robot

COONEO Autonomous Transport Robot is a highly integrated, agile, and efficient smart transport robot. It plans routes autonomously without track constraints, and its compact body and in-place turning let it move easily through elevators and narrow spaces. Able to handle hills and mountainous terrain, it is a versatile transport solution for multiple scenarios.

Performance & Applications

① Trackless autonomous route planning, free from the restrctions of fixed rails;
② Compact body with in-place turning for easy access to elevators and narrow spaces;
③ Precisely identifies human targets and synchronises starting and stopping, while supporting rear or side following. It is also equipped with obstacle-avoidance capabilities;
④ Capable of handling complex terrain such as hills, mountainous areas, and agricultural fields with slopes of up to 45°.

Fresh produce transportation during harvest seasons | Logistics transfer within agricultural parks | Warehouse material handling | Community supply delivery

Operating Modes

- **Remote Control Mode:** Allows precise manual takeover to handle unexpected situations and complex adjustments.
- **Automatic Following Mode:** Automatically follows a target, acting as a "carrying assistant" for workers and coordinating seamlessly with other machines for multi-robot collaboration.
- **Automatic Driving Mode:** Plans a complete route based on designated coordinates, avoids obstacles, memorises its path, and returns to the starting point upon task completionto achieve a fully unattended workflow.
